Due to the widespread use of mobile communication devices, it is often necessary for a user to use data networks outside of his or her normal office or home network environment. This is especially true in the case of the more advanced mobile devices such as mobile telephones, personal digital assistants (PDAs), etc. These devices often allow for the use of wireless communication networks, either in place of or in addition to their wired counterparts. This can be accomplished by a wide array of techniques such as, for example, Bluetooth, infra-red, and similar technologies. To ensure an easy portability of a mobile device, a number of techniques have been developed to provide for the use of a wide variety of data networks. For example, a user can activate a gateway or data network interface from his or her mobile device and obtain a data network address for the active gateway. In this way, the user can access data networks without having to carry a separate data network adapter. However, this approach can be cumbersome as the user typically has to manually initiate a connection with a gateway or data network interface. Some systems have been developed to address the problems of handling the connection with a wide variety of data networks. For example, U.S. Pat. No. 5,303,286, entitled "System And Method For Providing Portable Data Communications In A Public Communications Network" issued to Bellini, et al. (the '286 patent) discloses an "interim" cell phone or other portable mobile device which receives data communications in a public communications network over one or more "interim" data networks, e.g., CDPD, Mobitex, etc., at a predefined location in a predetermined coverage area. As such, the mobile device of the '286 patent can be left unattended at the predetermined location until such time as a mobile telephone call can be established over the public communications network and an associated "interim" data network. Once

such a call is established, the mobile device is allowed to communicate data over the public communications network. While the '286 patent
