The crack.Q: jquery mobile - what's is "jQuery Mobile" for? I'm new to mobile development and have been looking at some of the new frameworks and I came across one called jquery mobile. Are there any particular reason they created a framework like this? Isn't Jquery a css framework, and not a framework per se? A: jQuery Mobile isn't really a framework per se, it is simply a set of UI widgets that can be used inside an existing HTML document. jQuery Mobile is just a library, that is similar to other such libraries like Twitter Boostrap. It uses the jQuery framework to add functionality to the elements of the UI, allowing them to be styled as you wish. So jQuery Mobile by itself doesn't actually add any UI elements, but instead allows for the style to be added. Q: How to add visual elements to a top level window? In winforms, it's very simple to add visual components to a window, and the child window appears in the correct place on the screen. How to achieve the same thing when a window is top level? A: The way I do it is by nesting my Top Level form inside a form, named in Startup.cs public Main() { InitializeComponent(); Application.Run(new MainForm()); } I put some graphic controls in the main form, and they get correctly positioned with the correct top level parent. A: I think this will not work,because windows created by form inherits the form's default position and size and not the top level form's position and size. And windows are anchored on their parent(form in this case), which is the top level form. I think,if we could make windows which gets created with different design,then we could get proper positions(anywhere we like) by Windows.CreateWindow etc. But I still don't have any idea about the right way of doing this.
